# Plastic surgeon gives startling analysis of Madonna's drastic 'face' at Grammys 2023

The mega popstar is making non-stop headlines for her looks since her recent appearance at the Grammys 2023 on Sunday night, February 5. Madonna sparked controversies when she took the stage to present an award. Fans claimed they were left speechless by her drastically refined face, hinting she has gone under the knife.

The 64-year-old sparked a wave of intrigue after she seemed to have undergone a cosmetic procedure appearing wrinkle-free alongside a well-defined nose and cheeks. **However, the curiosity has prompted a plastic surgeon, Dr Michael Horn, to weigh in on what he believes the singer could have done, from "excessive filler and Botox" to a facelift and a nose job.**

Hailey Bieber flaunts 'natural' plump pout but fans believe she has a 'filler mustache' from lip injections

### **Who is Dr Michael Horn?**

**Dr Michael Horn is a certified plastic surgeon from Chicago, Illinois. He believed the 'Vogue' singer has undergone a couple of surgeries because of how uplifted her facial features appeared to look. "Over the years, Madonna, has seemingly undergone numerous plastic surgery procedures," he said. He claimed**

Madonna's recent appearance at Grammys 2023 was the most different-looking version of her to date. "She has undergone a facelift ... This is obvious because her skin is tight and pulled back with no wrinkles. Her eyes also seem smaller, likely due to being pulled during a facelift," he told Daily Mail.

Horn hinted Madonna had a nose job and said, "Madonna previously had a natural nose that suited her face. It appears as if she had rhinoplasty since this version has a pointy tip and seems too narrow." He claimed, "Botox was also evident on many areas of her face," while pointing out the lack of "expression lines and wrinkles," as well as her "minimal facial movement" during her speech. He speculated the star's structure of the face has noticeably changed the most.

'She has seemingly used excessive filler!'

"What is most noticeable and striking is the drastic change in Madonna's facial shape into a more V-shaped structure," he added. He went on to claim, "She has seemingly used excessive filler over time, giving her face a full appearance and taking away from the natural and pleasing bone structure she once had. Her cheekbones are more prominent than ever and appear unnaturally high."

Other than her drastic facial structure, Horn noted the 'Live To Tell' singer has also done a hairline surgery including an eyebrows lift. "It also appears that she had a brow lift which is made more noticeable by her thin eyebrows, which were formerly thick," he claimed. "It also appears that her hairline is wider now. It is

also likely that she had filler injected into the temples of her head," he concluded.
